# 1.Simulation Patterns

(1). Clear state feedback is a baseline need

Players need to know whether the bird is “away” or “back” and what to do next. Unclear states causes confusion or abandonment.

Script references: SIM-01-C/E; SIM-04-B/C/D

(2). Waiting preferences diverge

Some players accept or even like passive waiting; others see pure waiting as a reason to leave and want a meaningful decision during the wait.

Script references: SIM-01-B/D (accepts passive), SIM-03-A/D (dislike decision-free waiting), SIM-05-B (likes gentle routine)

(3). Rewards need meaning and differentiation

Players expect postcards and seeds to have separate homes (album vs. inventory) but want a consolidated “trip arrival summary”. If seeds are disconnected from travel locations, planting feels like “a second game bolted on.”

Script references: SIM-01-C; SIM-02-C/D; SIM-04-C

(4). Return motives spilt into “novelty/collection” and “attachment/ companionship”

Collector-type players (SIM-02) return for new content but tire of recolored repeats; attachment-type players (SIM-05) return for familiarity and character personality and tolerate some repetition.

Script references: SIM-01-E; SIM-02-B/E; SIM-05-A/C

(5). Persistence continuity and cross-device expectations diverge

Players generally expect reliable saving; multi-device players (SIM-05) expect cross-device sync, which browser-local storage may not satisfy, and mandatory registration deters some players (SIM-03).

Script references: SIm-01-D; SIM-02-D; SIM-03-D; SIM-04-D; SIM-05-D

# 2. Typical issues

1.Unclear travel state

Newcomers cannot tell whether the bird has left, whether they have anything to do, or whether the introduction is finished.

Script references: SIM-04-B/C; SIM-01-C/E

2. Non-obvious reward destinations

Players do not automatically understand the spilt-storage logic (“seeds go to backpack, postcards to mail/album”) and need a consolidated summary.

Script references: SIM-02-C; SIM-04-C

3. Waiting lacks engagement

Agency-seeking players find pure timer-waiting meaningless and want small

choices that affect outcomes.
Script references: SIM-03-C/D
4. Punitive mechanics drive churn
Streak breaks or missed-day item loss cause low-obligation players to quit outright.
Script references: SIM-01-B; SIM-05-B
5. Planting disconnected from travel
If seeds are interchangeable and unrelated to visited places, planting is perceived as a separate, superfluous second system.
Script references: SIM-02-D
6. Persistence expectations uncommunicated
Players invest time arranging the garden before realizing it only saves locally or does not sync across devices, causing disappointment.
Script references: SIM-05-D; SIM-03-D
7. Content repetition causes fatigue
Rewards that are the same image recolored, and checklist alone, are insufficient to sustain interest.
Script references: SIM-02-B

# 3.Counter-examples/Boundary Cases

1.“Waiting” is not universally negative
SIM-01 and SIM-05 accept or even enjoy passive waiting and gentle routines; SIM-03’s aversion cannot be generalized to all players.
Script references: SIM-01-B/D; SIM-05-B vs. SIM-03-A/D
2 “Daily routine” does not necessarily create pressure
SIM-05 likes a small daily action that aids memory, provided missing it is not punished and remainders are optional/off-switchable; SIM-01 dislikes streak penalties. The key distinction is “optional” vs. “punitive.”
Script references: SIM-05-B vs. SIM-01-B
3. Adding active choices is not a universal improvement
Adding agency to satisfy SIM-03 may increase burden for low-pressure players like SIM-01/SIM-05 and change the game’s relaxed positioning.
Script references: SIM-03-E
4. Separate storage does not necessarily need merging
SIM-02 supports keeping postcards and seeds separate; the objection is to the absence of a unified arrival summary, not to separation itself.
Script references: SIM-02-C
5. Clear explanation does not necessarily increase appeal
SIM-04 says clear guidance helps them decide but would not make them like waiting; SIM-03 similarly implies cannot overcome low appeal.

Script references: SIM-04-E; SIM-03-C/E
6. Newcomers are not necessarily the core target audience
SIM-04 is positioned as an “audience boundary test” representing people unfamiliar with the genre, not a confirmed target segment.
Script references: SIM-04 background note and Section 7 boundary case

# 4. To Be Validated

1. Whether state comprehension is an actual usability obstacle
Can real newcomers independently identify the bird's state and the next action?
References: H-01; SIM-01-C/E; SIM-04-B/C/D
2. Whether reward organisation causes confusion
With current separate storage (and any consolidated arrival summary), can real users locate both reward types?
References: cross-scenario synthesis table; SIM-01-C; SIM-02-C; SIM-04-C
3. Real preference distribution for waiting and daily routines
What proportion of the target audience accepts passive waiting vs. needs active decisions? Is optional routine sufficient to accommodate both?
References: H-03; SIM-01-B/D; SIM-03-A/D; SIM-05-B
4. Whether return motivation is novelty or attachment
After novelty fades, is attachment sufficient to sustain returns? Do the two overlap?
References: H-04; SIM-02-B/E; SIM-05-A/C; SIM-01-E
5. Persistence expectations vs. actual implementation
Do real users commonly use multiple devices? Is cross-device sync a necessary need? How much friction does mandatory registration add?
References: H-05; SIM-03-D; SIM-04-D; SIM-05-D
6. Value of content variety and character personality
Do distinctive postcards/story details and bird personality actually improve collection and attachment? Judgement requires seeing the actual art.
References: SIM-02-E; SIM-05-C/E
7. Audience boundary: should agency-seeking players and newcomers be in the primary target
SIM-03 represents a possible audience boundary; SIM-04 represents the newcomer onboarding lens. Adjusting direction for them requires real evidence.
References: Section 7 boundary case; SIM-03-E; SIM-04-E
8. Technical behaviour of the current build
Travel-state feedback, reward handling, and local persistence need technical/expert inspection rather than reliance on concept-level descriptions.
