Updated User Journey Map

Journey Overview and Flow

Open game → Check status/travel results → Claim rewards → Temporarily stop operating (idle) → Resume operating → Close game → Reopen

Stage	Player Behavior or Expectation	Potential Pain Points	Design Opportunities	Old-Version Correspondence	Change Annotation	Evidence
1.Open game	Opens during class breaks/waiting/before sleep, checks whether the bird has returned, collects items	Not knowing what they can do right now	Clearly display travel and character status	Core Goal "return to a familiar place, see a familiar character and a small understandable change"; Core Needs "clear travel state"	Behavior scenario refined: added specific opening occasions; expectation expanded from "see a change" to "check status + collect items"	SIM-01 Q1
2 Claim rewards	Views postcards, seeds, or other collectibles; expects rewards to differ	Repetitive content; weak link between rewards and character; consecutive similar items reduce willingness to click	Explore interaction between the bird and obtained items (follow-up candidate); reward differentiation	Core Needs "easily discoverable rewards"	Pain point strengthened: old version only had "easily discoverable"; added "similar rewards → stop clicking" churn signal; design opportunity added souvenir interaction	SIM-02 Q1, Q2; I-02

					(deferred from first version)	
3.Temporarily stop operating (idle)	Glances at the screen or turns attention elsewhere; doesn't keep it running and wait	Complete stillness lacks sense of life; frequent/repetitive actions feel mechanical	A few natural, low-frequency idle actions (preening, stretching, head-tilting), with intervals between actions	Old version had no idle-stage correspondence; Core Needs "optional interactions" only mentioned vaguely	New stage: old journey did not include an idle segment; this version adds it and specifies "low-frequency, spaced, non-fixed-loop"	SIM-01 Q2; SIM-03 Q1, Q2; I-01
4.Resume operating	Continues clicking, planting, or preparing for travel	Animations blocking entry points, interrupting operations; sound disturbance (especially outdoors)	Players operations take priority; idle actions interrupted immediately when necessary; animations don't block interaction entry points; sound effects switchable off	Core Needs "optional interactions (not wanting to be forced into actions)"	Pain points made concrete: refined from "not wanting to be forced" into three specific interferences: blocking, interruption, sound	SIM-04 Q1; I-03
5.Close game	Closes it first if there's nothing to do; doesn't keep it running	Worry about missing events or rewards while offline	No losses imposed for being offline; offline activity to be studied separately	Internal Tension "dislikes missing-day punishment"	Boundary clarified: old version was "internal tension to be tested"; this version clarifies it as a design	SIM-01 Q1; SIM-04 Q2; I-03

					boundary of "no losses imposed offline"	
6.Reopen	Hopes progress is saved and can return easily; seeing a small change on return would be nice, but doesn't need to run all the time	Offline pressure ("you didn't log in so you missed the reward"); unclear expectations about offline changes	Preserve progress; offline activity assessed separately, not included in first version	Core Needs "reliable persistence"; Internal Tension	Expectation supplemented: added the mild expectation of "seeing a small change on return," while clarifying "doesn't need to actually run all the time"	SIM-04 Q2

Change Summary

Change Type	Specific Change	Evidence
New stage	Added "Temporarily stop operating (idle)" stage; old journey had no such segment	SIM-01 Q2, SIM-03 Q1/Q2, I-01
Flow refinement	"Open game" supplemented with specific occasions (class breaks/waiting/before sleep); "Close game" made an independent stage	SIM-01 Q1, SIM-04 Q2
Pain point strengthened	Claim-rewards stage added "similar rewards → stop clicking" churn signal; idle stage added "mechanical repetition" pain point	SIM-02 Q1, SIM-03 Q2, I-01
Pain points made concrete	"Optional interactions" refined into three types: blocking entry points, interrupting operations, sound disturbance	SIM-04 Q1, I-03
Boundary clarified	Offline pressure clarified from "internal tension to be tested" to a design boundary of "no losses imposed"	SIM-04 Q2, I-03

Expectation supplemented	Reopen stage added the mild expectation of "seeing a small change," alongside "doesn't need to run all the time"	SIM-04 Q2

Unchanged Parts

The main stage sequence (open → check → claim → operate → close → reopen) is consistent with File 1's expected journey.

The two design opportunities "clearly display travel and character status" and "preserve progress" are retained.

Evidence Strength Notes

Stronger support: opening occasions, offline pressure boundary, blocking/sound concerns (SIM-01, SIM-04, consistent with I-03).

Weaker support: souvenir interaction (only SIM-02, who asked to see the actual implementation; I-02 marked "weak support").

Guard against: one cannot infer from SIM-03's liking of small actions that idle animations improve retention — SIM-01 treats them as a small detail).
