Persona Name

The Casual Idle-Game Player Who Plays in Fragmented Time

Usage Context

Opens the game during fragmented time such as class breaks, waiting, or before sleep, and may exit at any moment (SIM-01, SIM-04).

Usually does not "keep it running and wait"; if there is nothing to do, closes it first (SIM-01).

Sometimes plays on mobile outdoors and is sensitive to sound (SIM-04).

Core Goals

Check travel results and collect content (postcards, seeds, etc.), expecting rewards to differ (SIM-01, SIM-02).

Form a relaxed companion relationship with the bird, feeling that the character "persists and has its own habits" (SIM-03)

Possible Preferences

Simple controls, interruptible at any time.

The character has its own small habits: natural, low-frequency autonomous actions such as preening, head-tilting, stretching, and finding a spot to lie down (SIM-03; I-01).

Travel rewards differ; postcards "shouldn't just be a different background" (SIM-

02).

Collected items interact with the character, e.g., the bird fiddling with souvenirs (SIM-02; I-02, weak support).

Design Opportunities

Express the bird's sense of life through natural, low-frequency, interruptible autonomous actions while preserving the player's operating space.

Idle animations yield immediately when the player resumes operating, and do not block interaction entry points (I-03).

Explore interactions between the bird and obtained items as a later candidate feature (I-02, deferred from first version).

Clearly display travel and character state to avoid "not knowing what I can do right now".

Still Uncertain

Target population size, age distribution, actual usage duration/frequency, willingness to pay, retention.

Actually acceptable animation frequency and duration (I-03: acceptable frequency unknown).

Whether animations affect continued-play willingness — SIM-01 explicitly treats them as a "small detail"; animation favorability must not be equated with retention (I-01 counterpoint).

The real effect of souvenir interaction; judgment requires seeing the actual implementation (SIM-02; I-02 weak support).

• Expectations and implementation of the bird's activity while offline (SIM-04: seeing some change on return "would be nice," but "it doesn't need to actually run all the time").

Changes Relative to the Previous Version and Corresponding Evidence

	Change	Previous Version	Updated Version	Evidence/Insight
1	Persona name and positioning	"The low-Obligation Casual Player" (English; low-obligation as the core label)	"Casual Idle-Growth Player Who Plays in Fragmented Time"; core traits shifted to "fragmented time + idle companionship"	SIM-01 (class breaks/before bed, closes anytime)
2	Core goals	Return to a familiar place, see a familiar character and "a small but understandable change"	Added "check travel results and collected content; rewards must differ," and made explicit "the character persist and has its own habits"	SIM-01 (mainly checks whether there's something new on return), SIM-02 (postcards must differ), SIM-03 (shouldn't need me to click for it to react)
3	New "Possible Preferences" dimension	Previous version had no separate preference entries, only core needs	Added: natural low-frequency autonomous actions, reward differentiation, souvenir-character interaction	I-01, I-02, SIM-02, SIM-03
4	"Optional interactions" need made concrete	"Optional interactions (not wanting to be forced into actions)"	Refined into: animations don't block entry points, player operations take priority, can	SIM-04, I-03,

			leave anytime, sound can be turned off	
5	Internal Tension (To Be Tested)	Enjoys the “daily check-in” but strongly dislikes missing-day punishment (e.g., broken streaks, lost rewards)	Retained and expanded into the “offline pressure” boundary: no losses imposed for not being online; offline activity to be studied separately	Sim-04 (missing rewards creates pressure), I-03
6	Churn point	Repeating the same actions without growth/meaning leads to boredom and quitting	Retained, with concrete manifestations added: mechanical animation repetition, consecutive similar rewards	SIM-03 (repeating every few seconds feels mechanical), SIM-02 (won’t keep clicking if several consecutive items are similar), I-01
7	Usage context refinement	Short breaks or quiet evenings; time not fixed	Added specific scenarios “class breaks/waiting/before bed” and “playing on mobile outdoors, sensitive to sound	SIM-01, SIM-04
8	Unknowns expanded	Population size, age, frequency, payment, retention unknown	All retained, plus: acceptable animation frequency, animation’s effect on retention, actual souvenir-interaction effect, offline-activity expectations	I-01 counterpoint, I-02 limitations, I-03 limitations
9	Audience boundary personas	Retained “The Player Seeking Immediate Agency” and “The Genre Newcomer” as non-core audiences	Unchanged; these materials provide no new evidence on these two groups	-----

Parts Consistent with the Previous Version and Unchanged

The three core needs "clear travel state," "easily discoverable rewards," and

"reliable persistence" are retained (previous-version Core Needs; simulated materials offer no counter-evidence).

The two "audience boundary" personas (The Player Seeking Immediate Agency, The Genre Newcomer) are retained as-is.

Evidence Strength Notes

Stronger-support items: fragmented-time context, offline-pressure boundary, blocking/sound concerns (SIM-01, SIM-04, consistent with I-03).

Weaker-support items: souvenir-interaction preference (only SIM-02, who also asked to see the actual implementation; I-02 marked "weak support").

Inferences to guard against: one cannot infer from SIM-03's liking of small actions that animations improve retention — SIM-01 explicitly treats them as a small detail.
